#### Field of the Invention

The present invention relates to cyclic compounds and salts thereof, to methods of using such compounds in treating protein tyrosine kinase-associated disorders such as immunologic and oncologic disorders, and to pharmaceutical compositions containing such compounds.

#### **Background of the Invention**

Protein tyrosine kinases (PTKs) are enzymes which, in conjuction with ATP as a substrate, phosphorylate tyrosine residues in peptides and proteins. These enzymes are key elements in the regulation of cell signaling including cell proliferation and cell differentiation. PTKs comprise, inter alia, receptor tyrosine kinases (RPTKs), including members of the epidermal growth factor kinase family (e.g., HER1 and HER2), platelet derived growth factor (PDGF), and kinases that play a role in angiogenesis (Tie-2 and KDR); and, in addition, non-receptor tyrosine kinases, including members of the Syk, JAK and Src (e.g. Src, Fyn, Lyn, Lck and Blk) families (see Bolen, J.B., Rowley, R.B., Spana, C., and Tsygankov, A.Y., "The src family of tyrosine protein kinases in hemopoietic signal transduction", FASEB J., 6, 3403-3409 (1992); Ullrich, A. and Schlessinger, J., "Signal transduction by receptors with tyrosine kinase activity", Cell, 61, 203-212 (1990); and Ihle, J.N., "The Janus protein tyrosine kinases in hematopoetic cytokine signaling", Sem. Immunol., 7, 247-254 (1995)).

Enhanced activity of PTKs has been implicated in a variety of malignant and nonmalignant proliferative diseases. In addition, PTKs play a central role in the regulation of cells of the immune system. PTK inhibitors can thus impact a wide variety of oncologic and immunologic disorders. Such disorders may be ameliorated by selective inhibition of a certain receptor or non-receptor PTK, such as Lck, or due to the homology among PTK classes, by inhibition of more than one PTK by an inhibitor.

5

10

15

20

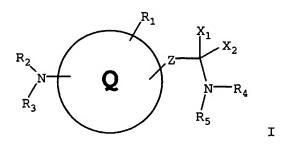

25

A PTK of particular interest is Lck which is found in T cells where it is involved in phosphorylating key protein substrates. It is required for productive antigen receptor signaling and cell activation. In the absence of Lck activity, the T cell receptor (TCR) zeta chain is not phosphorylated, the kinase ZAP-70 is not activated, and Ca<sup>2+</sup> mobilization essential for T cell activation does not occur (see Weiss, A. and Littman, D.R., "Signal transduction by lymphocyte antigen receptors", Cell, 76, 263-274 (1994); Iwashima, M., Irving, B.A., van Oers, N.S.C., Chan, A.C., and Weiss, A., "Sequential interactions of the TCR with two distinct cytoplasmic tyrosine kinases", Science, 263, 1136-1139 (1994); and Chan, A.C., Dalton, M., Johnson, R., Kong, G., Wang, T., Thoma, R., and Kurosaki, T., "Activation of ZAP-70 kinase activity by phosphorylation of tyrosine 493 is required for lymphocyte antigen receptor function", EMBO J., 14, 2499-2508 (1995)). Inhibitors of Lck are thus useful in the treatment of T-cell mediated disorders such as chronic diseases with an important T cell component, for example rheumatoid arthritis, multiple sclerosis and lupus, as well as acute diseases where T cells are known to play an essential role, for example acute transplant rejection and delayed-type hypersensitivity (DTH) reactions.

# **Detailed Description of the Invention**

The following are definitions of terms used in this specification.

The initial definition provided for a group or term herein applies to that group or term throughout the present specification, individually or as part of another group, unless otherwise indicated.

The terms "alk" or "alkyl" refer to straight or branched chain hydrocarbon groups having 1 to 12 carbon atoms, preferably 1 to 8 carbon

atoms. The expression "lower alkyl" refers to alkyl groups of 1 to 4 carbon atoms.

The term "alkenyl" refers to straight or branched chain hydrocarbon groups of 2 to 10, preferably 2 to 4, carbon atoms having at least one double bond. Where an alkenyl group is bonded to a nitrogen atom, it is preferred that such group not be bonded directly through a carbon bearing a double bond.

The term "alkynyl" refers to straight or branched chain hydrocarbon groups of 2 to 10, preferably 2 to 4, carbon atoms having at least one triple bond. Where an alkynyl group is bonded to a nitrogen atom, it is preferred that such group not be bonded directly through a carbon bearing a triple bond.

10

15

25

30

The term "alkylene" refers to a straight chain bridge of 1 to 5 carbon atoms connected by single bonds (e.g.,  $-(CH_2)_{X^-}$  wherein x is 1 to 5), which may be substituted with 1 to 3 lower alkyl groups.

The term "alkenylene" refers to a straight chain bridge of 2 to 5 carbon atoms having one or two double bonds that is connected by single bonds and may be substituted with 1 to 3 lower alkyl groups. Exemplary alkenylene groups are -CH=CH-CH=CH-, -CH2-CH=CH-,

20 -CH2-CH=CH-CH2-, -C(CH3)2CH=CH- and -CH(C2H5)-CH=CH-.

# Scheme A

Scheme A illustrates a general method for forming compound Ia, which is a compound of the formula I where  $X_1$  and  $X_2$  together form =0. As shown in Scheme A, compound Ia where  $R_2$  and  $R_3$  are hydrogen may be formed by saponification of  $\underline{\mathbf{i}}$ ,  $(R^*$  is a carboxyl protecting group such as alkyl or arylalkyl) followed by reaction with amine  $\underline{\mathbf{iii}}$  by methods known in the art. Alternatively  $\underline{\mathbf{i}}$  may be reacted with  $R_2L$ , where L is a leaving group such as halogen (for example, in equimolar portions), optionally followed by reaction with  $R_3L$  (for example, in equimolar portions) to form  $\underline{\mathbf{ii}}$ . Also alternatively,  $\underline{\mathbf{i}}$  may be subjected to reductive amination using the appropriate aldehyde or ketone to form  $\underline{\mathbf{ii}}$ . The compound  $\underline{\mathbf{ii}}$  may then be saponified and reacted with amine  $\underline{\mathbf{iii}}$ , under conditions known to those skilled in the art, to form Ia where  $R_2$  and/or  $R_3$  are other than hydrogen.

Scheme B illustrates a general method for forming compound Ib, which is a compound of formula I where Z is -CH=CH- and  $X_1$  and  $X_2$ together form =O. As shown in Scheme B, a 2-halo-compound vi can be prepared by reacting an appropriately substituted 2-amino-compound ia with copper (ii) halide and an alkyl nitrite such as tert-butyl nitrite in an aprotic solvent such as acetonitrile to form 2-halo-compound  $\underline{iv}$  (see J. # Scheme E

Scheme E illustrates a general method for forming compound Ie, which is a compound of the formula I where X<sub>1</sub> and X<sub>2</sub> are each hydrogen. As shown in Scheme E, the compound of the formula Id obtained in Scheme D may be converted into the corresponding amine Ie by reduction, for example, by reaction with Raney nickel.

Methods for preparing preferred substituents on the compounds I are illustrated in the following Schemes I to XI.

As shown in Scheme I, carboxylate  $\underline{i}$  can be reacted with a chloroformate or dicarbonate to form  $\underline{1}$ . Compound  $\underline{1}$  can be treated with a base such as sodium hydride, sodium/potassium hexamethyldisilazide, or lithium diisopropylamide (LDA), and an alkylating agent  $R_2X$  where X is halogen and  $R_2$  is preferably alkyl, arylalkyl, or cycloalkylalkyl, and then saponified with an aqueous base such as potassium hydroxide to give  $\underline{2}$ . Alternatively,  $\underline{1}$  can the subjected to reductive amination using the appropriate aldehyde or ketone and saponified with an aqueous base such as potassium hydroxide to give  $\underline{2}$ . Compound  $\underline{1}$  may, alternatively, be simply saponified with an aqueous base such as potassium hydroxide to give  $\underline{3}$  where  $R_2$  is hydrogen.

30

Acid  $\underline{2}$  may be reacted with an amine  $\underline{iii}$  using reaction conditions well known in the art for peptide bond synthesis (see, for example, Bodanszky and Bodanszky, The Practice of Peptide Chemistry, Springer-Verlag, 1984; Bodanszky, Principles of Peptide Synthesis, Springer-Verlag, 1984) to give the compound Id which a compound of the formula I where  $X_1$  and  $X_2$  together form =0,  $R_3$  is  $COOR_6$ , and, since  $\underline{2}$  is the starting material,  $R_2$  is preferably alkyl, arylalkyl or cycloalkylalkyl. For example, reagents which activate the carboxyl group of  $\underline{2}$  for reaction with the amine  $\underline{iv}$  include bis-(2-oxo-3-oxazolidinyl)phosphinic chloride (BOP chloride), benzotriazol-1-yloxy-tris(dimethylamino)phosphonium hexafluorophosphate (BOP reagent), [O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium] hexafluorophosphate (HATU), and carbodiimides such as dicyclohexylcarbodiimide (DCC) or 3-ethyl-3'-

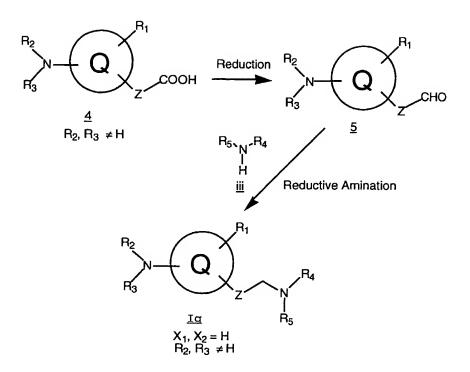

(dimethylamino)propylcarbodiimide (EDCI) either alone or in combination with a hydroxybenzotriazole. Alternatively, the activated ester intermediate can be isolated and then treated with the appropriate amine iv in a nonprotic solvent such as tetrahydrofuran (THF) or dimethylformamide (DMF) in the presence of a base, for example, an organic base such as sodium/potassium hexamethyldisilazide, triethylamine, diisopropylethylamine or 1,8-diazabicyclo[5.4.0]undec-7-

ene (DBU), or an inorganic base such as sodium, potassium or cesium carbonate or sodium or potassium hydride. Alternatively, the acid halide of  $\underline{2}$  may be prepared, for example, by reaction with thionyl chloride or oxalyl chloride, followed by subsequent reaction with amine  $\underline{iii}$  to provide compound If, which is a compound of the formula I where  $R_3$  is  $COOR_6$ ,  $X_1$  and  $X_2$  together form =0, and  $R_2$  is alkyl, arylalkyl or chycloalkylalkyl.

Similar reactions as employed above for the conversion of  $\underline{2}$  to If may be used to convert  $\underline{3}$  to If where  $R_3$  is  $COOR_6$ ,  $X_1$  and  $X_2$  together form =0, and  $R_2$  is hydrogen.

# Scheme II

As shown in Scheme II, acid  $\underline{4}$  where  $R_2$  and  $R_3$  are not hydrogen and are selected such that the nitrogen to which they are attached is non-basic, is reduced to the aldehyde  $\underline{5}$  by methods well know in the art (see March, Advanced Organic Chemistry, Wiley, 1985). For example, the acid  $\underline{4}$  may be converted to its corresponding ester followed by reduction with diisobutylaluminum hydride. Alternatively, the acid  $\underline{4}$  may be reduced to the corresponding primary alcohol, for example, by treatment with borane/THF, LiAlH<sub>4</sub>, or via reduction of a mixed anhydride, followed by subsequent oxidation to the aldehyde  $\underline{5}$  using Cr(VI) (e.g., pyridinium chlorochromate, "PCC") or under Swern or Moffatt conditions (e.g., (COCl)/dimethylsulfoxide). The starting acid  $\underline{4}$  may be obtained, for example, by saponification of  $\underline{ii}$ .

Reductive amination (see Hudlicky, Reductions in Organic Chemistry, Wiley, 1984) of aldehyde  $\underline{\mathbf{5}}$  with amine  $\underline{\mathbf{iii}}$  in the presence of a reducing agent such as NaBH<sub>3</sub>CN, NaBH(OAc)<sub>3</sub> (Ac = acetyl) or hydrogen and a palladium catalyst produces the amine compound Ig, which is a compound of the formula I where  $X_1$  and  $X_2$  are each hydrogen and  $R_2$  and  $R_3$  are each not hydrogen.

As shown in Scheme III, reduction of the acid  $\underline{4}$  to a primary alcohol (for example, by treatment with borane/tetrahydrofuran, LiAlH<sub>4</sub>, or via reduction of a mixed anhydride), followed by conversion by methods well known in the art (see March, Advanced Organic Chemistry, Wiley, 1985), provides  $\underline{6}$  which contains a leaving group such as a halide, tosylate (OTs), mesylate (OMs) or triflate (OTf). The groups  $R_2$  and  $R_3$  are selected such that the resulting nitrogen to which they are attached is non-basic. Compound  $\underline{6}$  can then be converted into compound Ih, which is a compound of the formula I where  $X_1$  and  $X_2$  are each hydrogen and  $R_2$  and  $R_3$  are each not hydrogen, by a displacement reaction with amine  $\underline{iii}$ , preferably where amine  $\underline{iii}$  is used in excess.

Ij, Ik, Il, Im and In are compounds of the formula I where  $R_2$  is any group as defined,  $R_3$  is an acyl or thioacyl group,  $X_1$  and  $X_2$  are not hydrogen, and  $R_1$  is not a primary or secondary amine. Ij, Ik, Il, Im and In have other particular substituents which are specified in this Scheme and below. The starting compound Ii can be prepared by suitable methods described in Schemes A and D.

Amide Ij can be prepared by treatment of amine compound Ii with a carboxylic acid  $\underline{7}$  in the presence of reagents which activate the carboxyl group for reaction as described above, for example BOP reagent, HATU, and carbodiimides such as DCC or EDCI either alone or in combination with a hydroxybenztriazole. Alternatively, the acid halide  $\underline{8}$  may be reacted with amine compound Ii in the presence of an acid scavenger such as diisopropylethylamine. The corresponding thioamide Ik can be prepared by the treatment of amide Ii (where  $X_1, X_2 \neq 0$ ) with Lawesson's reagent as described above.

Carbamate II can be prepared by treatment of amine compound Ii with a chloroformate  $\underline{9}$  or dicarbonate  $\underline{10}$  in the presence of an acid scavenger such as diisopropylethylamine.

The urea Im may be prepared by treatment of amine compound Ii with either: 1) a chloroformate  $\underline{9}$ , such as phenylchloroformate, followed by reaction with an amine  $\underline{11}$ ; 2) a carbamoyl chloride  $\underline{12}$  in the presence of an acid scavenger such as diisopropylethylamine; or 3) reaction with an isocyanate  $\underline{13a}$  (where  $R_c$  in Im = H). The corresponding thiourea In may be prepared by treatment of amine compound Ii with a thioisocyanate  $\underline{13b}$ .

 $R_a$  is selected from those groups included in the definition of  $R_6$  such that the group -C(=A)- $R_a$  is an acyl or thioacyl group within the definition of  $R_3$ .  $R_b$  and  $R_c$  are selected from those groups included in the definitions of  $R_7$  and  $R_8$ , such that the group -C(=A)-N( $R_b$ )( $R_c$ ) is an acyl or thioacyl group within the definition of  $R_3$ .

5

10

15

As shown in Scheme V, amine compound Io is reacted with an aldehyde or ketone  $\underline{14}$  under reductive amination conditions described above to give the amine Ip. Heterocyclic Chemistry*, 22, 1621 (1985)).

 $R_d$  and  $R_e$  are independently selected from hydrogen, alkyl, aryl, cycloalkyl or cycloalkenyl, or together are alkylene or alkenylene completing a 3- to 8-membered saturated or unsaturated ring, such that the group -CH( $R_d$ )( $R_e$ ) is a group within the definition of  $R_a$ .

Am. Chem. Soc., 118, 7215 (1996)) to give amine Is, which is a compound of the formula I having the particular substituents described in this Scheme. The compounds of the present invention inhibit protein tyrosine kinases, especially Src-family kinases such as Lck, Fyn, Lyn, Src, Yes, Hck, Fgr and Blk, and are thus useful in the treatment, including prevention and therapy, of protein tyrosine kinase-associated disorders such as immunologic and oncologic disorders. The compounds inhibit also receptor tyrosine kinases including HER1 and HER2 and are therefore useful in the treatment of proliferative disorders such as psoriasis and cancer. The ability of these compounds to inhibit HER1 and other receptor kinases will also permit their use as anti-angiogenic agents to treat disorders such as cancer and diabetic retinopathy. "Protein tyrosine kinase-associated disorders" are those disorders which result from aberrant tyrosine kinase activity, and/or which are alleviated by the inhibition of one or more of these enzymes. For example, Lck inhibitors are of value in the treatment of a number of such disorders (for example, the treatment of autoimmune diseases), as Lck inhibition blocks T cell

activation. The treatment of T cell mediated diseases, including inhibition of T cell activation and proliferation, is a particularly preferred embodiment of the present invention. Compounds which selectively block T cell activation and proliferation are preferred. Compounds of the present invention which block the activation of endothelial cell PTK by oxidative stress, thereby limiting surface expression of adhesion molecules that induce neutrophil binding, and which inhibit PTK necessary for neutrophil activation are useful, for example, in the treatment of ischemia and reperfusion injury.

The present invention thus provides methods for the treatment of protein tyrosine kinase-associated disorders, comprising the step of administering to a subject in need thereof at least one compound of the formula I in an amount effective therefor. Other therapeutic agents such as those described below may be employed with the inventive compounds in the present methods. In the methods of the present invention, such other therapeutic agent(s) may be administered prior to, simultaneously with or following the administration of the compound(s) of the present invention.

Use of the compounds of the present invention in treating protein tyrosine kinase-associated disorders is exemplified by, but is not limited to, treating a range of disorders such as: transplant (such as organ transplant, acute transplant or heterograft or homograft (such as is employed in burn treatment)) rejection; protection from ischemic or reperfusion injury such as ischemic or reperfusion injury incurred during organ transplantation, myocardial infarction, stroke or other causes; transplantation tolerance induction; arthritis (such as rheumatoid arthritis, psoriatic arthritis or osteoarthritis); multiple sclerosis; chronic obstructive pulmonary disease (COPD), such as emphysema; inflammatory bowel disease, including ulcerative colitis and Crohn's disease; lupus (systemic lupus erythematosis); graft vs. host disease; T-cell mediated hypersensitivity diseases, including contact hypersensitivity,

delayed-type hypersensitivity, and gluten-sensitive enteropathy (Celiac disease); psoriasis; contact dermatitis (including that due to poison ivy); Hashimoto's thyroiditis; Sjogren's syndrome; Autoimmune Hyperthyroidism, such as Graves' Disease; Addison's disease (autoimmune disease of the adrenal glands); Autoimmune polyglandular disease (also known as autoimmune polyglandular syndrome); autoimmune alopecia; pernicious anemia; vitiligo; autoimmune hypopituatarism; Guillain-Barre syndrome; other autoimmune diseases; cancers, including cancers where Lck or other Src-family kinases such as 10 Src are activated or overexpressed, such as colon carcinoma and thymoma, and cancers where Src-family kinase activity facilitates tumor growth or survival; glomerulonephritis; serum sickness; uticaria; allergic diseases such as respiratory allergies (asthma, hayfever, allergic rhinitis) or skin allergies; scleracierma; mycosis fungoides; acute inflammatory responses (such as acute respiratory distress syndrome and ishchemia/reperfusion 15 injury); dermatomyositis; alopecia areata; chronic actinic dermatitis; eczema; Behcet's disease; Pustulosis palmoplanteris; Pyoderma gangrenum; Sezary's syndrome; atopic dermatitis; systemic schlerosis; and morphea. The present invention also provides a method for treating 20 the aforementioned disorders such as atopic dermatitis by administration of any compound capable of inhibiting protein tyrosine kinase.

Src-family kinases other than Lck, such as Hck and Fgr, are important in the Fc gamma receptor responses of monocytes and macrophages. Compounds of the present invention inhibit the Fc gamma dependent production of TNF alpha in the monocyte cell line THP-1 that does not express Lck. The ability to inhibit Fc gamma receptor dependent monocyte and macrophage responses results in additional anti-inflammatory activity for the present compounds beyond their effects on T cells. This activity is especially of value, for example, in the treatment of inflammatory diseases such as arthritis or inflammatory bowel disease. In particular, the present compounds are of value for the treatment of

25

30

autoimmune glomerulonephritis and other instances of glomerulonephritis induced by deposition of immune complexes in the kidney that trigger Fc gamma receptor responses leading to kidney damage.

In addition, Src family kinases other than Lck, such as Lyn and Src, are important in the Fc epsilon receptor induced degranulation of mast cells and basophils that plays an important role in asthma, allergic rhinitis, and other allergic disease. Fc epsilon receptors are stimulated by IgE-antigen complexes. Compounds of the present invention inhibit the Fc epsilon induced degranulation responses, including in the basophil cell line RBL that does not express Lck. The ability to inhibit Fc epsilon receptor dependent mast cell and basophil responses results in additional anti-inflammatory activity for the present compounds beyond their effect on T cells. In particular, the present compounds are of value for the treatment of asthma, allergic rhinitis, and other instances of allergic disease.

The combined activity of the present compounds towards monocytes, macrophages, T cells, etc. may be of value in the treatment of any of the aforementioned disorders.

In a particular embodiment, the compounds of the present invention are useful for the treatment of the aforementioned exemplary disorders irrespective of their etiology, for example, for the treatment of transplant rejection, rheumatoid arthritis, multiple sclerosis, chronic obstructive pulmonary disease, inflammatory bowel disease, lupus, graft v. host disease, T-cell mediated hypersensitivity disease, psoriasis, Hashimoto's thyroiditis, Guillain-Barre syndrome, cancer, contact dermatitis, allergic disease such as allergic rhinitis, asthma, ischemic or reperfusion injury, or atopic dermatitis whether or not associated with PTK.

By virtue of their ability to inhibit HER1 and HER2 kinases, compounds of the present invention can also be used for the treatment of

proliferative diseases, including psoriasis and cancer. The HER1 receptor kinase has been shown to be expressed and activated in many solid tumors including non-small cell lung, colorectal, and breast cancer. Similarly, the HER2 receptor kinase has been shown to be overexpressed in breast, ovarian, lung and gastric cancer. Monoclonal antibodies that downregulate the abundance of the HER2 receptor or inhibit signaling by the HER1 receptor have shown anti-tumor effficacy in preclincal and clinical studies. It is therefore expected that inhibitors of the HER1 and HER2 kinases will have efficacy in the treatment of tumors that depend on signaling from either of the two receptors. These compounds are expected to have efficacy either as single agent or in combination with other chemotherapeutic agents such as placlitaxel (Taxol), doxorubicin hydrochloride (adriamycin), and cisplatin (Platinol). Enzyme Assay Using Lck, Fyn, Lyn, Hck, Fgr, Src, Blk or Yes

The following assay has been carried out using the protein tyrosine kinases *Lck*, *Fyn*, *Lyn*, *Hck*, *Fgr*, *Src*, *Blk* and *Yes*.

The protein tyrosine kinase of interest is incubated in kinase buffer (20 mM MOPS, pH7, 10 mM MgCl<sub>2</sub>) in the presence of the test compound. The reaction is initiated by the addition of substrates to the final concentration of 1 µM ATP, 3.3 µCi/ml [33P] gamma-ATP, and 0.1 mg/ml acid denatured enolase (prepared as described in Cooper, J.A., Esch, F.S., Taylor, S.S., and Hunter, T., "Phosphorylation sites in enclase and lactate dehydrogenase utilized by tyrosine protein kinases in vivo and in vitro", J. Biol. Chem., 259, 7835-7841 (1984)). The reaction is stopped after 10 minutes by the addition of 10% trichloroacetic acid, 100 mM sodium pyrophosphate followed by 2 mg/ml bovine serum albumin. The labeled enolase protein substrate is precipitated at 4 degrees, harvested onto Packard Unifilter plates and counted in a Topcount scintillation counter to ascertain the protein tyrosine kinase inhibitory activity of the test compound (activity inversely proportional to the amount of labeled enolase protein obtained). The exact concentration of reagents and the amount of label can be varied as needed.

This assay is advantageous as it employs an exogenous substrate (enolase) for more accurate enzyme kinetics, and can be conducted in a 96-well format that is readily automated. In addition, His-tagged protein tyrosine kinases (described below) offer much higher production yields and purity relative to GST-protein tyrosine kinase fusion protein.

The protein tyrosine kinase may be obtained from commercial sources or by recombinant methods described herewith. For the preparation of recombinant Lck, human Lck was prepared as a His-tagged fusion protein using the Life Technologies (Gibco) baculovirus vector

pFastBac Hta (commercially available) in insect cells. A cDNA encoding human Lck isolated by PCR (polymerase chain reaction) was inserted into the vector and the protein was expressed using the methods described by the manufacturer. The Lck was purified by affinity chromatography. For the production of Lck in insect cells using baculovirus, see Spana, C., O'Rourke, E.C., Bolen, J.B., and Fargnoli, J., "Analysis of the tyrosine kinase p56lck expressed as a glutathione S-transferase protein in Spodoptera frugiperda cells," Protein expression and purification, Vol. 4, p. 390-397 (1993). Similar methods may be used for the recombinant production of other Src-family kinases.

Enzyme Assay Using HER1 or HER2

5

10

15

20

25

30

Compounds of interest were assayed in a kinase buffer that contained 20 mM Tris.HCl, pH 7.5, 10 mM MnCl<sub>2</sub>, 0.5 mM dithiothreitol, bovine serum albumin at 0.1 mg/ml, poly(glu/tyr, 4:1) at 0.1 mg/ml, 1µM ATP, and 4 µCi/ml [gamma-<sup>33</sup>P]ATP. Poly(glu/tyr, 4:1) is a synthetic polymer that serves as a phosphoryl acceptor and is purchased from Sigma Chemicals. The kinase reaction is initiated by the addition of enzyme and the reaction mixtures were incubated at 26°C for 1 h. The reaction is terminated by the addition of EDTA to 50 mM and proteins are precipitated by the addition of trichloroacetic acid to 5%. The precipitated proteins are recovered by filtration onto Packard Unifilter plates and the amount of radioactivity incorporated is measured in a Topcount scintillation counter.

For the preparation of recombinant HER1, the cytoplasmic sequence of the receptor were expressed in insect cells as a GST fusion protein, which was purified by affinity chromatography as described above for Lck. The cytoplasmic sequence of HER2 was subcloned into the baculovirus expression vector pBlueBac4 (Invitrogen) and was expressed as an untagged protein in insect cells. The recombinant protein was partially purified by ion-exchange chromatography.

Phosphorylation of proteins is detected by anti-phosphotyrosine immunoblotting. Detection of phosphorylation of specific proteins of interest such as ZAP-70 is detected by immunoprecipitation with anti-ZAP-70 antibody followed by anti-phosphotyrosine immunoblotting. Such procedures are described in Schieven, G.L., Mittler, R.S., Nadler, S.G., Kirihara, J.M., Bolen, J.B., Kanner, S.B., and Ledbetter, J.A., "ZAP-70 tyrosine kinase, CD45 and T cell receptor involvement in UV and H<sub>2</sub>O<sub>2</sub> induced T cell signal transduction", J. changes in the blue/violet indo-1 ratio as described in Schieven, G.L., Mittler, R.S., Nadler, S.G., Kirihara, J.M., Bolen, J.B., Kanner, S.B., and Ledbetter, J.A., "ZAP-70 tyrosine kinase, CD45 and T cell receptor involvement in UV and H<sub>2</sub>O<sub>2</sub> induced T cell signal transduction", J. Biol. Chem., 269, 20718-20726 (1994), and the references incorporated therein.

#### (3) Proliferation assays

Lck inhibitors inhibit the proliferation of normal human peripheral blood T cells stimulated to grow with anti-CD3 plus anti-CD28 antibodies.

A 96 well plate is coated with a monoclonal antibody to CD3 (such as G19-4), the antibody is allowed to bind, and then the plate is washed. The antibody bound to the plate serves to stimulate the cells. Normal human peripheral blood T cells are added to the wells along with test compound plus anti-CD28 antibody to provide co-stimulation. After a desired period of time (e.g., 3 days), the [3H]-thymidine is added to the cells, and after further incubation to allow incorporation of the label into newly synthesized DNA, the cells are harvested and counted in a scintillation counter to measure cell proliferation.

#### Examples 13 to 53

General Procedure

15 Compounds 13 to 53 were prepared following the procedure described below. Appropriate amines (0.40 mmol) and diisopropylethylamine (70 µL, 0.40 mmol) were added to a suspension of 1C (100 mg, 0.36 mmol) in dichloromethane (3 mL). The solution was stirred mechanically in a sealed tube at rt for 16 h. The reaction mixtures were diluted with methanol (200 μL) and loaded in Varian SCX ion exchange columns (2 g/6 cc) pretreated 20 with methanol-dichloromethane (8 mL, 1:1) followed by dichloromethane (8 mL). SCX Column filtration were performed using a Gilson robot unit. The column was washed sequentially with dichloromethane (9 mL), dichloromethane-methanol (9 mL, 4:1), dichloromethane-methanol (9 mL, 25 1:1), methanol (9 mL), 0.01 M ammonium hydroxide in methanol (9 mL) and 0.05 M ammonium hydroxide in methanol (9 mL). The elutes were collected separetely by the robot and then concentrated using a speed vac. Fractions containing the products were combined.

"HPLC Ret Time" is the HPLC retention time under the following conditions: YMC S5 ODS 4.6 x 50 mm Ballastic Column, 4 min gradient starting from 100% solvent A (10% MeOH, 90%  $H_2O$ , 0.2%  $H_3PO_4$ ) to 100% solvent B (90% MeOH, 10%  $H_2O$ , 0.2%  $H_3PO_4$ ), flow rate 4 mL/min,  $\lambda$  = 220 nM.

#### Examples 54 to 129

#### General Procedure

Compounds 54 to 129 were prepared following the procedure described below. Diisopropylethyl amine (60 µL, 0.34 mmol) was added to a mixture of amine 2 (30 mg, 0.11 mmol), appropriate carboxylic acid (0.13 mmol), 1hydroxy-7-azabenzotriazole (19.5 mg, 0.14 mmol), and ethyl-3-(3dimethylamino)-propyl carbodiimide hydrochloride (26.8 mg, 0.14 mmol) in THF (0.4 mL). The mixture was heated in a sealed tube under argon at 45°C for 24 h. The reaction mixture was diluted with dichloromethane (4 10 mL) and washed with 2 N aq. HCl solution (2 mL, 3x). The dichloromethane solution was passed through a Varian SCX cation exchange column (2 g, 6 cc) on a Gilson robot. The column was eluted sequentially with acetonitrile-methanol (10 mL, 4:1), methanol-2M 15 methanolic ammonia (3 mL, 4:1), and 2 M methanolic ammonia solution (3 mL, 4x). The fractions were collected separately using the Gilson robot. Fraction containing the product was concentrated and dried in vacuo. "HPLC Ret Time" is the HPLC retention time under the following conditions: YMC S5 ODS 4.6 x 50 mm Ballastic Column, 4 min gradient starting from 100% solvent A (10% MeOH, 90% H,O, 0.2% H,PO,) to 100% 20 solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>), flow rate 4 mL/min,  $\lambda = 220$ nM for compounds 54 - 127. For compounds 128 -129 HPLC conditions are: Zorbax S8-C18 4.5 mm x 7.5 cm short column, 8 min gradient starting from 100% solvent A (10% MeOH, 90% H,O, 0.2% H,PO, ) to 100% solvent B (90% MeOH, 10%  $H_2O$ , 0.2%  $H_3PO_4$ ), flow rate 2.5 mL/min,  $\lambda = 217$  nM. 25

#### Example 181

## Preparation of [5-[[(2,4,6-Trimethylphenyl)amino]carbonyl]-4-methyl-2-thiazolyl]carbamic acid, phenyl ester

5

A 10% aq. KHCO<sub>3</sub> solution (170 mL) was added to a stirred solution of 2 (1.02 g, 3.7 mmol) in THF (130 mL). Phenylchloroformate (1.39 mL, 11.1 mmol) was added dropwise. The biphasic mixture was stirred at rt overnight, diluted with dichloromethane (200 mL) and washed with water (50 mL, 2x) and brine. The organic extract was separated, dried (MgSO<sub>4</sub>), filtered and concentrated. The residue was chromatographed on a silica gel column and eluted with 10% EtOAc in hexanes to obtain the title compound (980 mg, 69%) as a solid.

#### Examples 182 to 236

#### General Procedure

Compounds 182 to 236 were prepared following the procedure described below.

A solution of phenylcarbamate 181 (20 mg, 0.054 mmol) and the appropriate amine (0.08 mmol) in THF-acetonitrile (3 mL, 1:1) was stirred at rt overnight. Some of the reactions required heating to 60 °C for 4 h to overnight. The mixture was diluted with dichloromethane (4 mL) and washed with 1 N aq. HCl solution (1.5 mL, 2x), 1 N aq. NaOH solution

(1.5 mL, 2x). The dichloromethane extract was separated, dried (MgSO $_4$ ), filtered and concentrated to obtain the title product.

"HPLC Ret Time" is the HPLC retention time under the following conditions: For compounds 182-192 HPLC conditions are: Zorbax SB-C18

4.5 mm x 7.5 cm short column, 8 min gradient starting from 100% solvent A (10% MeOH, 90% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>) to 100% solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>), flow rate 2.5 mL/min, λ = 217 nM. For compounds 193-236 HPLC conditions are: YMC S5 ODS 4.6 x 50 mm Ballastic Column, 4 min gradient starting from 100% solvent A (10% MeOH, 90% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>) to 100% solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>), flow rate 4 mL/min, λ = 220 nM.

### Examples 237 to 285

#### General Procedure

Compounds 237to 285 were prepared following the procedure described

5 below.

A solution of phenylcarbamate 181 (20 mg, 0.054 mmol) and the appropriate amine (0.08 mmol) in THF-acetonitrile (3 mL, 1:1) was stirred at rt overnight. The mixture was diluted with dichloromethane (4 mL) and washed with 1 N aq. HCl solution (1.5 mL, 2x), 1 N aq. NaOH solution (1.5 mL, 2x). The dichloromethane extract was separated, dried (MgSO<sub>4</sub>), filtered and concentrated to obtain the title product.

"HPLC Ret Time" is the HPLC retention time under the following conditions: For compounds 237-278 HPLC conditions are: YMC S5 ODS 4.6 x 50 mm Ballastic Column, 4 min gradient starting from 100% solvent A (10% MeOH, 90% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>) to 100% solvent B (90% MeOH, 10% H<sub>2</sub>O, 0.2% H<sub>3</sub>PO<sub>4</sub>), flow rate 4 mL/min, λ = 220 nM. For compounds 279-285 HPLC conditions are: Zorbax S8-C18 4.5 mm x 7.5 cm short

column, 8 min gradient starting from 100% solvent A (10% MeOH, 90%  $H_2O$ , 0.2%  $H_3PO_4$ ) to 100% solvent B (90% MeOH, 10%  $H_2O$ , 0.2%  $H_3PO_4$ ), flow rate 2.5 mL/min,  $\lambda$  = 217 nM.
